
SkillsUSA 2023 Additive Manufacturing State Challenge

Kinematic Assembly Models

Welcome to the “Kinematic Assembly Models” challenge!

The task at hand is to design a functional/movable assembly, also known as a gear system, or kinematic model.

Examples of this type of system are below, this should help get you started on an idea:

- Peristaltic Pump
- Geneva Gear
- Rack and Pinion
- Differential
- Planetary Gear
- Bearing

Example of a functional assembly for reference only

Competition Requirements

1. The design **must** contain at least 3 individual bodies to be printed assembled or to be assembled after printing.
2. Printed parts **must** be able to mate and stay together during operation by design or additional hardware provided by contestant.
3. The design **must** contain at least two printed moving parts in the assembly.
4. One printed part's motion **must** be directly driven by another printed parts motion.
5. The printed parts **must** be able to mate together as an assembly, as designed, without major post-processing.
6. The design **must** be able to rotate/move as designed and should not have excessive backlash.
7. The design **can** contain up to 6 additional store-bought hardware to aid in the final assembly; If used, these shall be provided by the contestant.
8. 3D Printed Design - Students **must** create a design that:
 - Is original and designed by contestant
 - Prints all parts in less than **8** hours*
 - Uses less than **5** cubic inches of model and/or support combined for all parts*

**As processed in GrabCAD Print- <https://grabcad.com/print?locale=en> (you may have to sign up; it is free of charge). Choose the F170 3D Printer as template printer and select 0.010" as the layer slice height.*
9. Students **must** submit files to be evaluated no later than 5 PM CST on Friday, March 24th. Please email processed GrabCAD file (.print) and mesh file (.stl) to apanek@depcollc.com.

Tips for Competitors

Here are some tips to maximize the points awarded to you:

- Be sure to design using the correct tolerance between printed parts to allow motion of assembly.
- Be creative by incorporating an end-use for the design.
- Additional moving parts may add to your score but can produce more points of failure on the final assembly.
- Try to leverage design for 3D technology to reduce the amount of additional hardware needed for final assembly.

- Use online resources (YouTube, GrabCAD Tutorials, Cornell's Kinematic Models for Design)
- Whenever intellectual property (IP) deters you from a project, try using approximate geometries to communicate the design intent
- Solve a problem that impacts multiple people
- Optional design for additive manufacturing learning resources:
 - Stratasys Think Additively™ Masterclass:

State Competition Procedure

Before or on contest day:

1. Students submit Engineering Notebook (Engineering notebook guidelines below)- Day of contest
2. Students submit GrabCAD Print file (.print) and mesh file (.stl) to apanek@depcollc.com by 5 PM CST on 3/24/2023
3. Students submit physical parts- Day of contest
4. Students submit final assembly if applicable- Day of contest
5. Students submit their Presentation- Day of contest

State Competition Judging Criteria

1. The Engineering Notebook should contain robust content, including at a minimum the following:
 - 1.1. Be clearly labeled with contestant name(s), date and page # on each page
 - 1.2. Begin with a problem statement
 - 1.3. Include discovery and documentation of approach to solve problem
 - 1.4. Include sketched design concepts with critical features labeled
 - 1.5. Critical dimensions clearly labeled in design sketch
 - 1.6. Considerations for designing for additive manufacturing distinctly addressed (i.e. part strength, part orientation) especially including any expected risks during printing
 - 1.7. Screenshots of the print time and material usage for all printed parts (as processed in GrabCAD Print)
 - 1.8. Design decisions and alternatives are documented and evaluated thoughtfully
2. The design must adhere to the Competition Requirements stated in the prior page.

-
3. Quality of final assembly
 - 3.1. Does it perform the function in the manner it was designed to do?
 - 3.2. Does it meet all requirements in contest guidelines?
 - 3.3. Do inserted components or multiple printed parts mate together properly?
 - 3.4. Did the students design the part with additive manufacturing in mind?
 - 3.5. Is there sufficient tolerance between parts for movement?

 4. The design must illustrate best practices for “design for additive manufacturing (DFAM)”. Below are some *potential* DFAM metrics to optimize for.
 - 4.1. Build Time
 - 4.2. Material Consumption
 - 4.3. Functionality Optimization (gear ratio, pliability, strength, etc.)
 - 4.4. Component Consolidation (lack of store-bought hardware)
 - 4.5. Light-weighting for Ergonomics

 5. Presentation Criteria
 - 5.1. The team clearly describes their understanding of the problem to be solved.
 - 5.2. Design Process: good design logic is used for key design choices. Intentional and well-communicated
 - 5.3. The presentation is professional and well-rehearsed
 - 5.4. The presentation emphasizes quantitative improvements (measured and estimated) of the time, quality, or cost of the improvement as well as any DFAM tactics employed.
 - 5.5. Practical evaluation: team demonstrates visually (videos, photos, drawings, animation, etc) the task they improved, both before and after.
